Survey of Educational Objectives of Kashan University of Medical Sciences Departments in 2002

Mehdain M, Moniri R, Vakili Z, Ramzani Y

Introduction. For improving every educational system, clarification of aims and identification of priorities is essential. For this reason curriculum planning committee of EDC followed up faculty members to essential objective writing methods.

Methods. This was a descriptive study for analyzing educational objectives of various courses in different departments of Kashan University of Medical Sciences in 2002.

After collecting the objectives from related departments, they were considered according to their domains and classes by EDC. SPSS was used for descriptive analysis.

Result. 8113 educational objectives were assessed. Among them, 96.7% were in cognitive domain, 1.6% in affective and 1.8% in psychomotor domain. According to bloom classification, different classes of cognitive domain also were assessed and 37.7% of objectives were in knowledge, 37.6% in comprehensive, 18.8% in application, 5.3% in analysis, 2.7% in synthesis and only 0.9% were in evaluation and judgment class.

Conclusion. The main part of objectives were written in cognitive domain, specially in knowledge and comprehension classes. With suitable feedback to departments, curriculum planning committee can lead them in writing the objectives in high classes of bloom classification if needed for the course according to courses specially for Medical and B.S courses.

Knowledge of Anesthesia Technician Students about their course. A descriptive study at Kashan University of Medical Sciences-2002.

Mirhoseiny F, Mahdian M, Akbari H

Introduction. Since the selection of academic course is very important to job selection. A study for considering the anesthesia technician student’s knowledge about their course was necessary. This study was performed for this reason at Kashan university of medical sciences in 2002.

Methods. For this descriptive study a questionnaire was designed in 2 sections: First section, included age, sex, priority of selection and so on. Second section was to some extent about job description and education continuing. For statistical analysis SPSS software was used (t and chi-square tests).

Results. Based on the obtained information (of 50 students) 22% were male and 78% female. 70% of students were admitted into university in 1999 and 30% in 2000. According to the results, before course selection, 65.3% had no consultation or any other consideration to get it. 18/8% had good, 50% moderate and 31.2% poor knowledge before course selection (P=0.008). The knowledge score of the males was 9.3±3.5 and females 5.9±3.8 (P=0.015). Knowledge score of 1999 and 2000 admissions were 6.4±3.9 and 7.3±3.8 respectively. Among good knowledge scores, 31.3% had consultation and 12.5% had no consultation.

Discussion. According to our results, most of the students had no knowledge or search about their course before selection. We found that the more consultation increased, the more knowledge increased. To improve the course selection in the next generation, we hope the students choose their course more accurately.

Comparison of Graduate Medical Education in Iran with WFME International Guidelines: Quality Improvement in Postgraduate Medical Education

Mirzazadeh A, Tavakoli S, Naseripoor M

In 2001, following the development of International Standards in basic medical education, WFME appointed
an international Task Force for development of International Guidelines for Postgraduate Specialist Training. Reports of this Task Force were published in September 2001. These Guidelines has been structured in 9 areas and 37 sub-areas. The areas of these guidelines are mission & outcomes, training process, assessment of trainees, trainees, staffing, training setting and educational resources, evaluation of training programme, governance and administration, and quality review and continuous improvement. In each area, there are one or more sub-areas in which the quality postgraduate training is defined in two level of basic and quality improvement standards.

Comparison of Graduate Medical Education system in Iran regarding related Rules and Bylaws specially Policies & Procedures and educational standards of new evaluation and accreditation of GME with WFME International Guidelines: Quality improvement in Postgraduate Medical Education can highlight the strengths and weaknesses of this system. In this article, first we describe each standard of WFME Guidelines, and then compare our system with it. The results of this comparison reveal that our GME system has appropriate to full compliance with 34 of 37 basic standards of WFME for Postgraduate Specialist Training.

Student Ratings of Instruction: True or False

Motlagh MS, Jahanmardi A

Introduction. Students' evaluation of teaching is a major concern in higher education. In this regard, during the past 30 years hundreds of papers have been published which because of various grounds from valid, reliable to useless, such papers cannot be easily summarized. The present study investigated for two purposes, first was to outline opinions of two groups of advocates and opposites about validity and reliability of SET. The second purpose was to represent conceptual fallacies at SET process.

Methods. This study was a library research of original and review papers over SET. In this regard from one thousand papers, two hundreds were chosen randomly, then the information were collected and analyzed comparatively.

Results. Findings showed that SET advocates believed that students have a metacognition, so they have a valid judgment through SET but opposites stated that student's judgments are subjective, so they are not valid. The first group (advocates) say that SET is reliable because of correlation between SET of current students and alumni, more over similarity of SET results of one teacher through years, that research has indicated. On the other hand advocates say that SET reliability is affected by educational contexts, student characteristics, teacher characteristics and course characteristics. Conceptual fallacies at SET are: (a) that students are the only reliable information source (b) the existence of a unique and immutable metric term: "teaching effectiveness", and (c) opinion is a fact.
